

SQL Anywhere[®] for Windows[®] Mobile

PRODUCT DATASHEET

SQL Anywhere 12 includes UltraLite[®], a lightweight relational database and data synchronization client for Windows Mobile devices, used on both smartphones and ruggedized enterprise handheld computers. Developers can use UltraLite to build robust mobile applications, extending enterprise data to mobile users.

BRINGING SQL ANYWHERE TO WINDOWS MOBILE

With over ten million deployed databases and eight hundred partners, SQL Anywhere is a trusted technology that successful companies use when building mobile and embedded solutions. SQL Anywhere provides key database and data synchronization capabilities so that customers can build applications on a foundation of secure, reliable, scalable and high performance technology.

Windows Mobile continues to be the platform of choice for many enterprise applications running on enterprise handheld computers, including delivery, field service, inspections, asset management and more.

SQL Anywhere for Windows Mobile offers a combination of database and data synchronization technology that complements existing offerings from Microsoft, and gives developers what they need to build tomorrow's mobile enterprise applications. A single synchronization server integrates BlackBerry[®], Windows Mobile, iPhone[®], and Windows clients into enterprise systems.

DATABASE FEATURES

UltraLite is a lightweight relational database.

It provides table-based storage in a single database store with SQL access, primary and foreign keys, indexing for fast data retrieval, transaction support including atomic transactions (rollback and commit), geospatial data support, active database features, and database recovery.

DATA SYNCHRONIZATION FEATURES

UltraLite is a client for SQL Anywhere MobiLink[™] data synchronization.

It provides the ability to carry out change-based, two-way data synchronization on subsets of a database or on a complete database. Synchronization operates over TCP/IP, HTTP or HTTPS. Each data upload to the server or download from the server is carried out as a single transaction.

As a synchronization client, UltraLite provides on-device change tracking and synchronization functions so that developers can build data synchronization right into their applications. Together with MobiLink it lets you extend Oracle, SQL Server, DB2, Sybase ASE, SQL Anywhere or MySQL databases to mobile devices, and also provides an interface for other enterprise systems and interfaces such as Enterprise Resource Planning applications and web services. MobiLink is a mature data synchronization technology that has been used in many enterprise environments with thousands of clients.

SYSTEM REQUIREMENTS

To develop Windows Mobile applications you must have the appropriate development tools. UltraLite is intended for use with Visual Studio, and provides both managed code (.NET) and unmanaged code (C++) interfaces.
